

Project Proposal

Title: Bank Management System(C++).

Course Code: HU-1101

Course Title: Programming Fundamentals

Presented To: Prof. Awais Rathore

Presented By: Misbah Khurshid

Roll No: 2025-SE-10

Department: Software Engineering

Introduction

1. This is a **console-based banking system** developed using **C++** to stimulate **real-world bank account operations**.
2. It allows users to:
 - **Create new accounts**
 - **Performs deposits and withdrawals**
 - **Track transactions**
 - **Categorized accounts based on account balance**

Why This Project Is Needed

Small companies often face problems like:

- **No proper record of transaction & account payments.**
- **Difficulty tracking daily expenses & operational costs.**
- **Manual calculation of interest, balances & profit.**

These problems cause:

- **Financial confusion & mismanagement.**
- **Time wastage in manual processing.**
- **Calculation errors affecting accounts & reports.**

Purpose

- **To create a simple computerized Bank Management System using C++ that automates transaction recording, expense tracking.**

Key Features of My Project

➔ Account Management

- Create new bank account
- Use existing account
- Store details (name, account type and balance)

➔ Transaction System

- Deposit money & Withdraw money
- Allow repeated transactions in one session

➔ Account Type Classification

- Low balanced account ≤ 10000
- Saving account ≤ 30000
- Premium account ≤ 70000
- Standard account > 70000

Outcomes

- Proper use of C++ fundamentals
- Menu-driven and user-friendly banking system
- Real-world banking logic implementation
- Accurate balance and transaction calculations

Clear understanding of:

- Functions
- Do-while Loop
- Pointers
- Arrays
- If-else conditions
- Menu-driven programming

Future Scope of the Project

Add graphical user interface (GUI)

Convert into web-based system

Connect with database for record storage

Online payment tracking

Convert into web-based system

Online transaction and payment tracking

Conclusion

- **This project demonstrates the practical use of C++ programming to build a simple bank management system.**
- **It handles account creation, and transactions efficiently using basic programming concepts.**
- **The system provides a clear understanding of real-world banking operations and logical problem-solving skills.**

Thank You

More Ideas. More Energy. More Impact.
